

CI / CD

Using Github Actions & Heroku

What is Continuous Integration (CI)?

- Continuously integrate changes into a current build
 - E.g. “develop”-branch in the Git Workflow
- Emphasis on automated testing

What is Continuous Delivery (CD)?

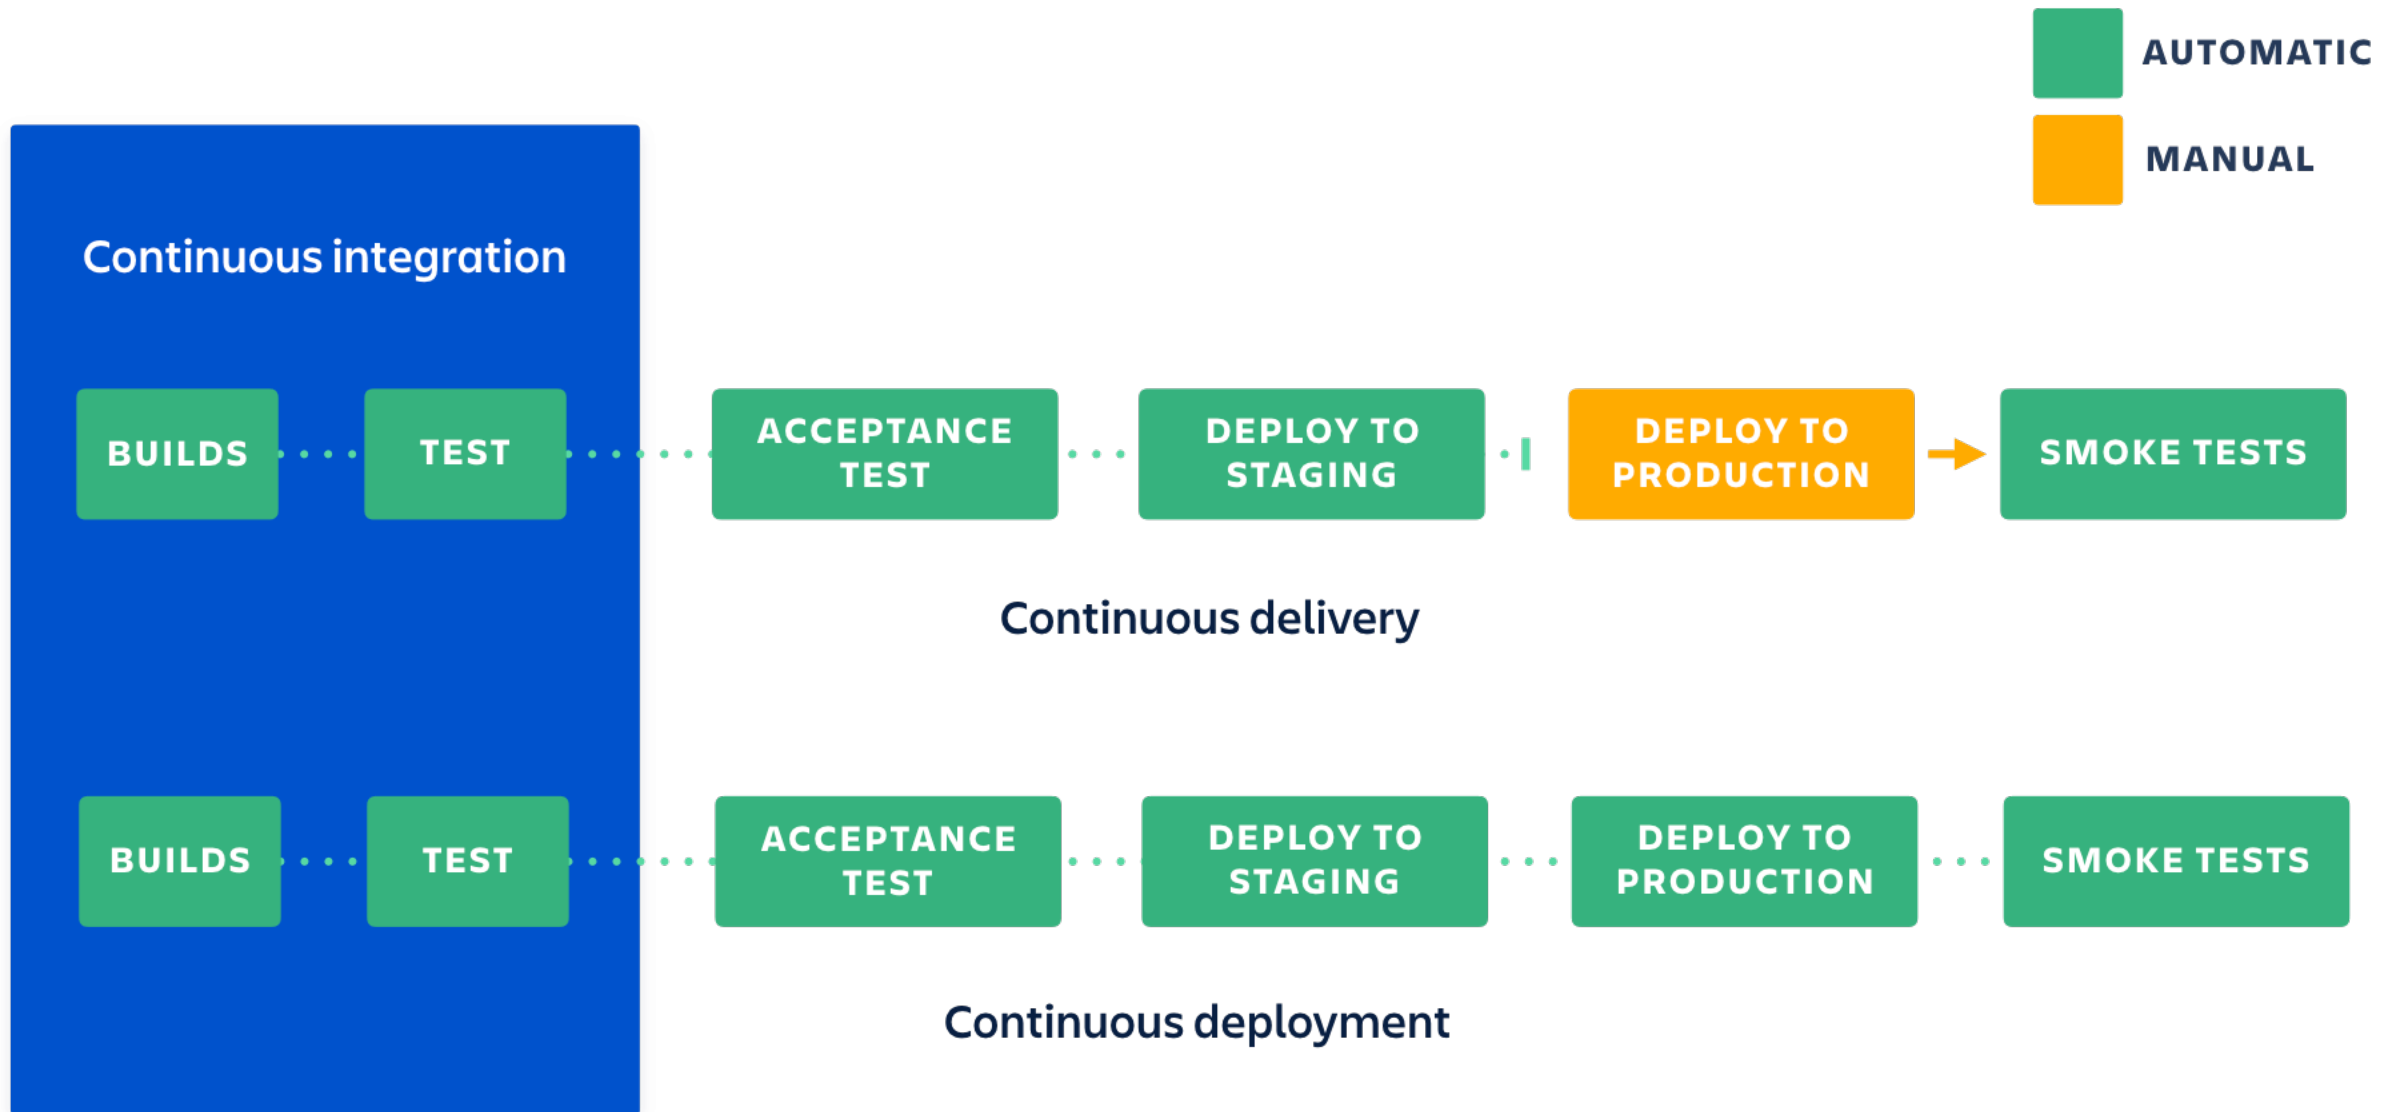

- Continuously integrate changes into a current build
- Continuously test software to ensure a functional build can be deployed at any time
 - E.g. weekly/monthly releases

What is Continuous Deployment (CD)?

- Continuously integrate changes into a current build
- Continuously test software to ensure a functional build can be deployed at any time
- Continuously deploy changes to the customer

Pros / Cons of CI/CD

PRO

- Short release cycles
- Responsive development
- Helps maintain consistent code quality
- Easier cooperation in large teams

CON

- Management of project can become complex
- Relies on complex software management tools
- Robust communication and planning necessary
- Requires robust automated tests

Github Actions

For CI / CD

- Define a CI/CD Pipeline in your project in:
.github/workflow/pipeline.yml
- Define the triggers and individual steps.

Your workflow name.

name: Deploy to heroku.

Run workflow on every push to master branch.

on:

push:

branches: [main, test-h2-be]

Your workflows jobs.

jobs:

say-hello:

runs-on: ubuntu-latest

steps:

- **name:** Greet

run: echo "Hello"

test: ...

Example Project

Continuous Delivery of Web-App using Heroku

- Goal: Create a CI / CD Pipeline that tests, builds and deploys a Web-App automatically after each commit.
- Exercises distributed separately
